

Here at Portable Cooling Solutions Australia, we import “Port-A-Cool” Evaporative Upright Coolers from the USA for Sales and Hire.

Water quality throughout Australia can be problematic. We suffer from highly mineralised and very hard water. Resulting scale among other issues will reduce the life of anything our water runs through.

As water is the key to cooling via our Units, water quality matters. Poor water quality and scale build up reduces the life of the pump, motor, pads and indeed the whole Unit itself!

We’ve attempted over the years to find some sort of a solution.

We found the maintenance free, Ecosoft Water Conditioner, through Mike at Ecosoft Water.

Mike has shown us how the Ecosoft system works and over the last six years we’ve installed this device into a lot of our products.

Throughout the years that we’ve used the Ecosoft devices in our units, we have had great success. Replacement of internal components is no longer a common need with the Ecosoft device eliminating minerals and scale.

We’ve supplied a lot of these devices specifically to the mining industry where a lot of ground water is used. All our clients have noticed a huge improvement in longevity of the pads, pumps and motors. Cleaning and maintenance of the units is also made quite simple as the minerals aren’t calcified to the point they would have to be scraped as they have in the past. Additionally, any scale that was present at the time of fitting the Ecosoft device is now nonexistent.

We also use the Ecosoft devices in our Hire Units. This action has effectively added years of service to the Units and to all the internal components that we would have been changing over regularly, without this device installed.

The Ecosoft Device is very simple to install and requires no further action.

We find all our customers are as impressed as we are with the way the Turbo Flow works. It truly does what it says it does!!

We would very highly recommend the Ecosoft to anybody who has issues with quality of water. Whether hard or soft water, mineralised water, or where evaporation causes residual mineralisation deposits to occur, the Ecosoft Device is the answer.

From a business point of view it’s been a great and true solution to an everyday problem.

Thank you Mike!
